#### **Declaration of Conformity**

Manufacturer hereby states that the drive product range conforms to the relevant safety provisions of the following council directives: 2004/108/EC (EMC) and 2006/95/EC (LVD) (Valid until 20.04.2016) 2014/30/EU (EMC) and 2014/35/EU (LVD) (Valid from 20.04.2016)

Designed and manufactured in accordance with the following harmonised European standards:

EN 61800-5-1: 2003	Adjustable speed electrical power drive systems. Safety requirements. Electrical, thermal and energy.
EN 61800-3 2 <sup>nd</sup> Ed: 2004 / A1 2012	Adjustable speed electrical power drive systems. EMC requirements and specific test methods
EN 55011: 2007	Limits and Methods of measurement of radio disturbance characteristics of industrial, scientific and medical (ISM) radio-frequency equipment (EMC)
EN60529 : 1992	Specifications for degrees of protection provided by enclosures

#### **Electromagnetic Compatibility**

All drives are designed with high standards of EMC in mind. All versions suitable for operation on Single Phase 230 volt and Three Phase 400 volt supplies and intended for use within the European Union are fitted with an internal EMC filter. This EMC filter is designed to reduce the conducted emissions back into the supply via the power cables for compliance with the above harmonised European standards. It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with the EMC legislation of the country of use. Within the European Union, equipment into which this product is incorporated must comply with the EMC Directive 2004/108/EC. This User Guide provides guidance to ensure that the applicable standards may be achieved.

All rights reserved. No part of this User Guide may be reproduced or transmitted in any form or by any means, electrical or mechanical including photocopying, recording or by any information storage or retrieval system without permission in writing from the publisher.

# **Copyright Beijer Electronics © 2016**

All drive units carry a 2 year warranty against manufacturing defects from the date of manufacture. The manufacturer accepts no liability for any damage caused during or resulting from transport, receipt of delivery, installation or commissioning. The manufacturer also accepts no liability for damage or consequences resulting from inappropriate, negligent or incorrect installation, incorrect adjustment of the operating parameters of the drive, incorrect matching of the drive to the motor, incorrect installation, unacceptable dust, moisture, corrosive substances, excessive vibration or ambient temperatures outside of the design specification.

The local distributor may offer different terms and conditions at their discretion, and in all cases concerning warranty, the local distributor should be contacted first.

The contents of this User Guide are believed to be correct at the time of printing. In the interest of a commitment to a policy of continuous improvement, the manufacturer reserves the right to change the specification of the product or its performance or the contents of the User Guide without notice.

#### This User Guide is for use with version 3.04 firmware. User Guide Revision 1.20

The manufacturer adopts a policy of continuous improvement and whilst every effort has been made to provide accurate and up to date information, the information contained in this User Guide should be used for guidance purposes only and does not form the part of any contract.

This manual is intended as a guide for proper installation. Beijer Electronics cannot assume responsibility for the compliance or the non-compliance to any code, national, local or otherwise, for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

This BFI-E3 contains high voltage capacitors that take time to discharge after removal of the main supply. Before working on the drive, ensure isolation of the main supply from line inputs. Wait ten (10) minutes for the capacitors to discharge to safe voltage levels. Failure to observe this precaution could result in severe bodily injury or loss of life.

Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equipment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life.

# 1. Quick Start Up

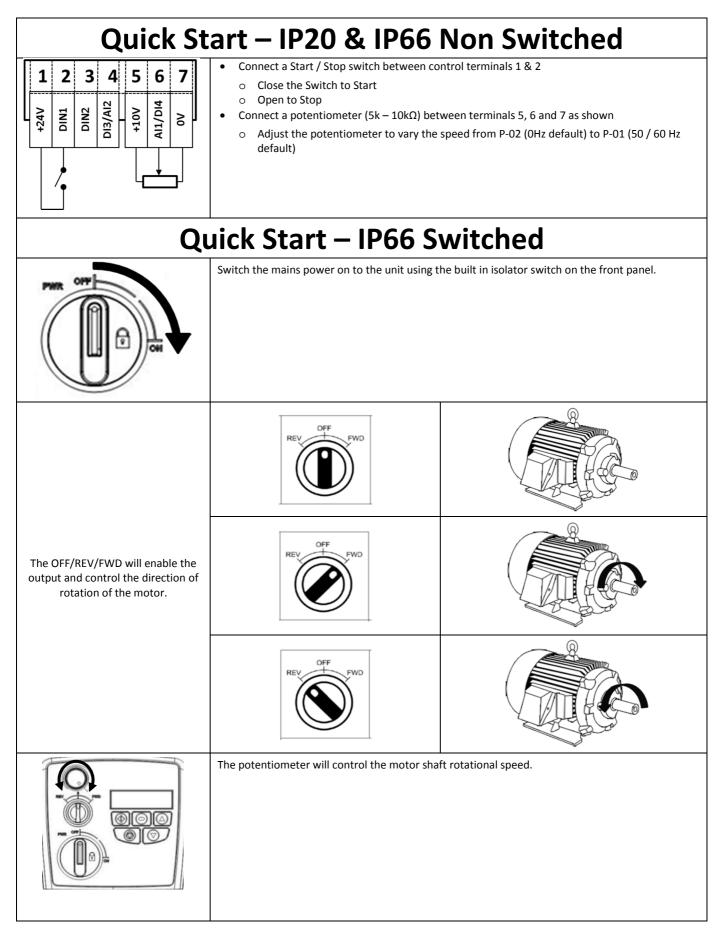

# 1.1. Important Safety Information

Please read the IMPORTANT SAFETY INFORMATION below, and all Warning and Caution information elsewhere.

Δ	Danger : Indicates a risk of electric shock, which, if not Danger : Indicates a potentially hazardous situation
14	avoided, could result in damage to the equipment and // other than electrical, which if not avoided, could result
	possible injury or death.
Â	This variable speed drive product is intended for professional incorporation into complete equipment or systems as part of a fixed installation. If installed incorrectly it may present a safety hazard. The drive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control mechanical plant that may cause injury. Close attention is required to system design and electrical installation to avoid hazards in either normal operation or in the event of equipment malfunction. Only qualified electricians are allowed to install and maintain this product. System design, installation, commissioning and maintenance must be carried out only by personnel who have the necessary training and experience. They must carefully read this safety information and the instructions in this Guide and follow all information regarding transport, storage, installation and use of the drive, including the specified environmental limitations. Do not perform any flash test or voltage withstand test on the drive. Any electrical measurements required should be carried out with the drive disconnected. Electric shock hazard! Disconnect and ISOLATE the drive before attempting any work on it. High voltages are present at the terminals and within the drive for up to 10 minutes after disconnection of the electrical supply. Always ensure by using a suitable multimeter that no voltage is present on any drive power terminals prior to commencing any work. Where supply to the drive is through a plug and socket connector, do not disconnect until 10 minutes have elapsed after turning off the supply. Ensure correct earthing connections. The earth cable must be sufficient to carry the maximum supply fault current which normally
	<ul> <li>will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.</li> <li>Ensure correct earthing connections and cable selection as per defined by local legislation or codes. The drive may have a leakage current of greater than 3.5mA; furthermore the earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive,</li> </ul>
	according to any local legislation or codes.
	Do not carry out any work on the drive control cables whilst power is applied to the drive or to the external control circuits.
	Within the European Union, all machinery in which this product is used must comply with Directive 98/37/EC, Safety of Machinery. In particular, the machine manufacturer is responsible for providing a main switch and ensuring the electrical equipment complies with EN60204-1.
	The level of integrity offered by the drive control input functions– for example stop/start, forward/reverse and maximum speed is not sufficient for use in safety-critical applications without independent channels of protection. All applications where malfunction could cause injury or loss of life must be subject to a risk assessment and further protection provided where needed.
	The driven motor can start at power up if the enable input signal is present.
	The STOP function does not remove potentially lethal high voltages. ISOLATE the drive and wait 10 minutes before starting any work on it. Never carry out any work on the Drive, Motor or Motor cable whilst the input power is still applied.
	The drive can be programmed to operate the driven motor at speeds above or below the speed achieved when connecting the motor directly to the mains supply. Obtain confirmation from the manufacturers of the motor and the driven machine about suitability for operation over the intended speed range prior to machine start up.
	Do not activate the automatic fault reset function on any systems whereby this may cause a potentially dangerous situation.
	IP20 drives must be installed in a pollution degree 2 environment, mounted in a cabinet with IP54 or better.
	Drives are intended for indoor use only.
	When mounting the drive, ensure that sufficient cooling is provided. Do not carry out drilling operations with the drive in place,
	dust and swarf from drilling may lead to damage.
	The entry of conductive or flammable foreign bodies should be prevented. Flammable material should not be placed close to the drive
	Relative humidity must be less than 95% (non-condensing).
	Ensure that the supply voltage, frequency and no. of phases (1 or 3 phase) correspond to the rating of the drive as delivered.
	Never connect the mains power supply to the Output terminals U, V, W.
	Do not install any type of automatic switchgear between the drive and the motor
	Wherever control cabling is close to power cabling, maintain a minimum separation of 100 mm and arrange crossings at 90 degrees
	Ensure that all terminals are tightened to the appropriate torque setting
	Do not attempt to carry out any repair of the drive. In the case of suspected fault or malfunction, contact your local Drives Sales Partner for further assistance.

# 1.2. Quick Start Process

Step	Action		See Section	Page
1	<ul> <li>Identify the Enclosure Type, Model Type and ratings of your drive from the model code on the label. # 3. Mechanical Installation

# 3.1. General

- The drive should be mounted in a vertical position only on a flat, flame resistant vibration free mounting using the integral holes or DIN Rail clip (Frame Sizes 1 and 2 only).Do not mount flammable material close to the drive.
- The drive must be installed in a pollution degree 1 or 2 environment only.
- Do not mount flammable material close to the BFI.
- Ensure that the minimum cooling air gaps are left clear.
- Ensure that the ambient temperature range does not exceed the permissible limits for the drive given in section 9.1.
- Provide suitable clean, moisture and contaminant free cooling air sufficient to fulfil the cooling requirements of the drive.

# 3.2. UL Compliant Installation

Refer to section 9.4 on page 29 for Additional Information for UL Compliance.

### 3.3. Mechanical Dimensions and Mounting – IP20 Open Units

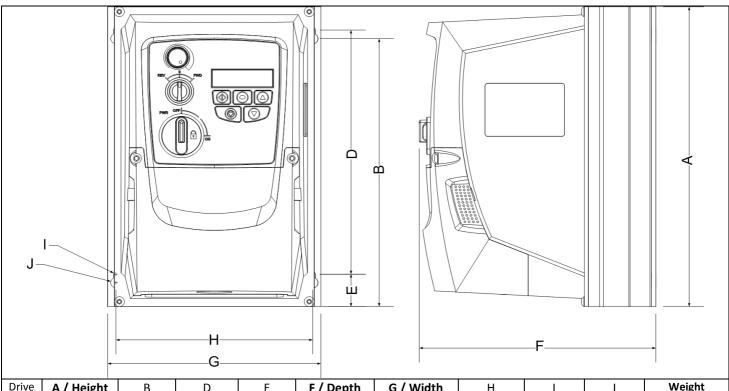

# 3.4. Guidelines for Enclosure Mounting - IP20 Units

- IP20 drives are suitable for use in pollution degree 1 environments, according to IEC-664-1. For pollution degree 2 or higher environments, drives should be mounted in a suitable control cabinet with sufficient ingress protection to maintain a pollution degree 1 environment around the drive.
- Enclosures should be made from a thermally conductive material.
- Ensure the minimum air gap clearances around the drive as shown below are observed when mounting the drive.
- Where vented enclosures are used, there should be venting above the drive and below the drive to ensure good air circulation see the diagram below. Air should be drawn in below the drive and expelled above the drive.
- In any environments where the conditions require it, the enclosure must be designed to protect the BFI against ingress of airborne dust, corrosive gases or liquids, conductive contaminants and sprays or splashing water from all directions.
- High moisture, salt or chemical content environments should use a suitably sealed (non-vented) enclosure.

The enclosure design and layout should ensure that the adequate ventilation paths and clearances are left to allow air to circulate through the drive heatsink. The drive manufacturer recommend the following minimum sizes for drives mounted in non-ventilated metallic enclosures:-

	Drive	Х	Y	Z	Recommended
X Z	Size	Above &Below	<b>Either Side</b>	Between	airflow
		mm	mm	mm	CFM (m <sup>3</sup> /min)
( ତିହିତ୍ରତି)	1	50	50	33	0.14
	2	75	50	46	0.27
	3	100	50	52	0.74
Y	4	100	50	52	1,48
		ypical drive heat lo on Z assumes that			
(	Above a	re guidelines only e MUST be mainta		-	temperature of

# 3.5. Mechanical Dimensions – IP66 Enclosed Units

Drive	A / Height	В	D	E	F / Depth	G / Width	Н	I	J	Weight

Tightening Torques			me Sizes	Control Terminals: 0.5 Nm						
			THE SIZES	Power Termi	nals: 1 Nm					

# 3.6. Guidelines for Mounting Enclosed Units

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 9.1
- The drive must be mounted vertically, on a suitable flat surface
- The minimum mounting clearances as shown in the table below must be observed
- The mounting site and chosen mountings should be sufficient to support the weight of the drives
- Using the drive as a template, or the dimensions shown below, mark the locations required for drilling
- Suitable cable glands to maintain the ingress protection of the drive are required. Gland holes for power and motor cables are premoulded into the drive enclosure, recommended gland sizes are shown above. Gland holes for control cables may be cut as required

	Drive Size	X Above & B	elow Y	′ Either Side
Х		mm		mm
	1, 2 and 3	200		10
			Note :

	1	PG 13,5	PG 13,5	PG 13,5
	2	PG 21	PG 21	PG 13.5
	3	PG 21	PG 21	PG 13.5
X				

# 3.7. Gland Plate and Lock Off

The use of a suitable gland system is required to maintain the appropriate IP / Nema rating. The gland plate has pre moulded cable entry holes for power and motor connections suitable for use with glands as shown in the following table. Where additional holes are required, these can be drilled to suitable size. Please take care when drilling to avoid leaving any particles within the product.

	Power & M	otor Cables	Control & Signal Cables				
	Moulded Hole Size	Moulded Hole Size Imperial Gland		Imperial Gland			
Size 1	1 22mm PG13.5		22mm	PG13.5			
Size 2 & 3	27mm	PG21	22mm	PG13.5			
Flexible Conduit Hole Sizes:							
	Drill	Size	Trade	e Size			
Size 1	28r	nm	3/4	in			
Size 2 & 3	35r	nm	1 in				
• UL rated ingress protection ("Type ") is only met when cables are installed using a UL recognized bushing or fitting for a flexible-							

conduit system which meets the required level of protection ("Type").

- For conduit installations the conduit entry holes require standard opening to the required sizes specified per the NEC.
- Not intended for rigid conduit system.

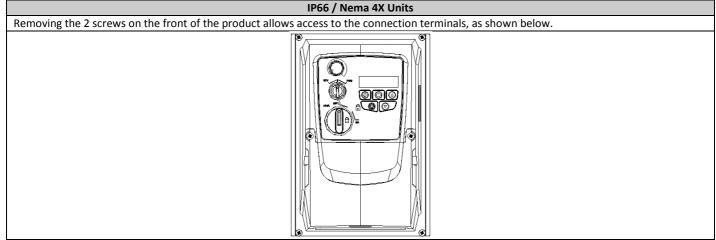

#### Power Isolator Lock Off

On the switched models the main power isolator switch can be locked in the 'Off' position using a 20mm standard shackle padlock (not supplied).

# 3.8. Removing the Terminal Cover

To access the connection terminals, the drive front cover needs to be removed as shown.

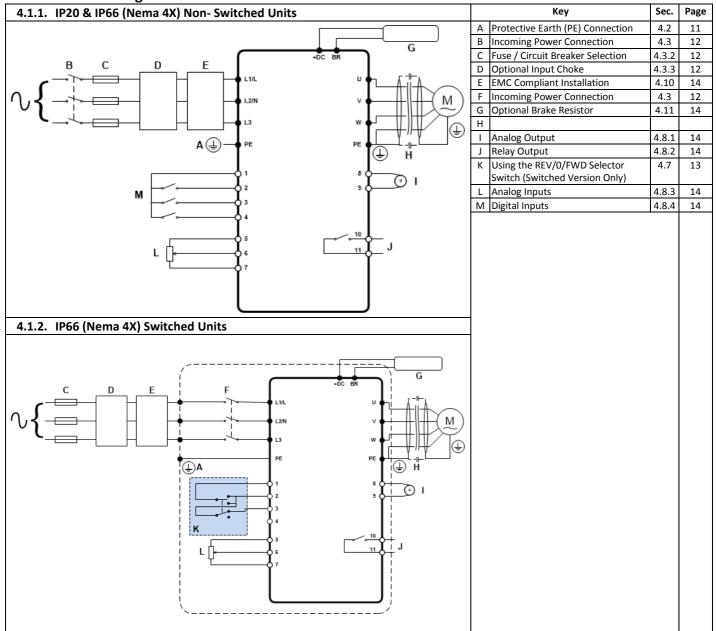

# 3.9. Routine Maintenance

The drive should be included within the scheduled maintenance program so that the installation maintains a suitable operating environment, this should include:

- Ambient temperature is at or below that set out in the "Environment" section.
- Heat sink fans freely rotating and dust free.
- The Enclosure in which the drive is installed should be free from dust and condensation; furthermore ventilation fans and air filters should be checked for correct air flow.

Checks should also be made on all electrical connections, ensuring screw terminals are correctly torqued; and that power cables have no signs of heat damage.

# 4.1. Connection Diagram

# 4.2. Protective Earth (PE) Connection

#### **Grounding Guidelines**

The ground terminal of each drive should be individually connected DIRECTLY to the site ground bus bar (through the filter if installed). Drive ground connections should not loop from one drive to another, or to, or from any other equipment. Ground loop impedance must confirm to local industrial safety regulations. To meet UL regulations, UL approved ring crimp terminals should be used for all ground wiring connections. The drive Safety Ground must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be checked periodically. Protective Earth Conductor

The Cross sectional area of the PE Conductor must be at least equal to that of the incoming supply conductor.

#### Safety Ground

This is the safety ground for the drive that is required by code. One of these points must be connected to adjacent building steel (girder, joist), a floor ground rod, or bus bar. Grounding points must comply with national and local industrial safety regulations and/or electrical codes.

#### Motor Ground

The motor ground must be connected to one of the ground terminals on the drive.

#### **Ground Fault Monitoring**

As with all inverters, a leakage current to earth can exist. The drive is designed to produce the minimum possible leakage current whilst complying with worldwide standards. The level of current is affected by motor cable length and type, the effective switching frequency, the earth connections used and the type of RFI filter installed. If an ELCB (Earth Leakage Circuit Breaker) is used, the following conditions apply: -

- A Type B Device must be used
- The device must be suitable for protecting equipment with a DC component in the leakage current
- Individual ELCBs should be used for each drive

#### Shield Termination (Cable Screen)

The safety ground terminal provides a grounding point for the motor cable shield. The motor cable shield connected to this terminal (drive end) should also be connected to the motor frame (motor end). Use a shield terminating or EMI clamp to connect the shield to the safety ground terminal.

# 4.3. Incoming Power Connection

#### 4.3.1. Cable Selection

- For 1 phase supply, the mains power cables should be connected to L1/L, L2/N.
- For 3 phase supplies, the mains power cables should be connected to L1, L2, and L3. Phase sequence is not important.
- For compliance with CE and C Tick EMC requirements, refer to section 4.10 EMC Compliant Installation on page 14.
- A fixed installation is required according to IEC61800-5-1 with a suitable disconnecting device installed between the BFI-E3 and the AC Power Source. The disconnecting device must conform to the local safety code / regulations (e.g. within Europe, EN60204-1, Safety of machinery).
- The cables should be dimensioned according to any local codes or regulations. Maximum dimensions are given in section 9.2.

#### 4.3.2. Fuse / Circuit Breaker Selection

- Suitable fuses to provide wiring protection of the input power cable should be installed in the incoming supply line, according to the data in section 9.2 Rating Tables. The fuses must comply with any local codes or regulations in place. In general, type gG (IEC 60269) or UL type J fuses are suitable; however in some cases type aR fuses may be required. The operating time of the fuses must be below 0.5 seconds.
- Where allowed by local regulations, suitably dimensioned type B MCB circuit breakers of equivalent rating may be utilised in place of fuses, providing that the clearing capacity is sufficient for the installation.
- The maximum permissible short circuit current at the BFI-E3 Power terminals as defined in IEC60439-1 is 100kA.

#### 4.3.3. Optional Input Choke

- An optional Input Choke is recommended to be installed in the supply line for drives where any of the following conditions occur:-
- The incoming supply impedance is low or the fault level / short circuit current is high
- The supply is prone to dips or brown outs
- An imbalance exists on the supply (3 phase drives)
- The power supply to the drive is via a busbar and brush gear system (typically overhead Cranes).
- In all other installations, an input choke is recommended to ensure protection of the drive against power supply faults. Part numbers are shown in the table.

Supply	Frame Size	AC Input Inductor
220 Valt	1	OPT-2-L1016-20
230 Volt 1 Phase	2	OPT-2-L1025-20
1 PlidSe	3	N/A
	2	OPT-2-L3006-20
400 Volt	2	OPT-2-L3010-20
3 Phase	3	OPT-2-L3036-20
	4	OPT-2-L3050-20

#### 4.4. Motor Connection

- The drive inherently produces fast switching of the output voltage (PWM) to the motor compared to the mains supply, for motors which have been wound for operation with a variable speed drive then there is no preventative measures required, however if the quality of insulation is unknown then the motor manufacturer should be consulted and preventative measures may be required.
- The motor should be connected to the BFI-E3 U, V, and W terminals using a suitable 3 or 4 core cable. Where a 3 core cable is utilised, with the shield operating as an earth conductor, the shield must have a cross sectional area at least equal to the phase conductors when they are made from the same material. Where a 4 core cable is utilised, the earth conductor must be of at least equal cross sectional area and manufactured from the same material as the phase conductors.
- The motor earth must be connected to one of the BFI-E3 earth terminals.

# 4.5. Motor Terminal Box Connections

Most general purpose motors are wound for operation on dual voltage supplies. This is indicated on the nameplate of the motor. This operational voltage is normally selected when installing the motor by selecting either STAR or DELTA connection. STAR always gives the higher of the two voltage ratings.

Incoming Supply Voltage	Motor Nameplate Voltages		Connection
230	230 / 400	Delta	
400	400 / 690		
400	230 / 400	Star	

# 4.6. Control Terminal Wiring

- All analog signal cables should be suitably shielded. Twisted pair cables are recommended. •
- Power and Control Signal cables should be routed separately where possible, and must not be routed parallel to each other. .
- Signal levels of different voltages e.g. 24 Volt DC and 110 Volt AC, should not be routed in the same cable. .
- Maximum control terminal tightening torque is 0.5Nm. .
- Control Cable entry conductor size: 0.05 2.5mm<sup>2</sup> / 30 12 AWG. .

# 4.7. Using the REV/0/FWD Selector Switch (Switched Version Only)

By adjusting the parameter settings the BFI-E3 can be configured for multiple applications and not just for Forward or Reverse. This could typically be for Hand/Off/Auto applications (also known and Local/Remote) for HVAC and pumping industries. 1

REV FWD	REV FWD	OFF FWD			
				eters to	
	Switch Position		-	Set	Notes
Run Reverse	STOP	Run Forward	<b>P-12</b>	<b>P-15</b>	Factory Default Configuration Run Forward or Reverse with speed controlled from the Local POT
STOP	STOP	Run Forward	0	5,7	Run forward with speed controlled form the local POT Run Reverse - disabled
Preset Speed 1	STOP	Run Forward	0	1	Run Forward with speed controlled from the Local POT Preset Speed 1 provides a 'Jog' Speed set in P-20
Run Reverse	STOP	Run Forward	0	6, 8	Run Forward or Reverse with speed controlled from the Local POT
Run in Auto	STOP	Run in Hand	0	4	Run in Hand – Speed controlled from the Local POT Run in Auto 0 Speed controlled using Analog input 2 e.g. from PLC with 4-20mA signal.
Run in Speed Control	STOP	Run in PI Control	5	1	In Speed Control the speed is controlled from the Local POT In PI Control, Local POT controls PI set point
Run in Preset Speed Control	STOP	Run in PI Control	5	0, 2, 4,5, 812	In Preset Speed Control, P-20 sets the Preset Speed In PI Control, POT can control the PI set point (P-44=1)
Run in Hand	STOP	Run in Auto	3	6	Hand – speed controlled from the Local POT Auto – Speed Reference from Modbus
Run in Hand STOP Run in Auto		3	3	Hand – Speed reference from Preset Speed 1 (P-20) Auto – Speed Reference from Modbus	
NOTE To be able	e to adjust parameter P	-15, extended menu a	ccess mu	st be set i	n P-14 (default value is 101)

# 4.8. Control Terminal Connections

Default Connections	Control Terminal	Signal	Description	
			+24Vdc user output, 100mA	
	1	+24Vdc User Output	Do not connect an this terminal.	external voltage source to
	2	Digital Input 1	Positive logic "Logic 1" input voltage range	2:8V 30V DC
	3	Digital Input 2	"Logic 0" input voltage range	
	4	Digital Input 3 / Analog Input 2	Digital: 8 to 30V Analog: 0 to 10V, 0 to 20mA	or 4 to 20mA
5	5	+10V User Output	+10V, 10mA, 1kΩ minimum	
	6	Analog Input 1 / Digital Input 4	Analog: 0 to 10V, 0 to 20mA Digital: 8 to 30V	or 4 to 20mA
	7	0V	0 Volt Common, internally co	onnected to terminal 9
(v) (v) (v)	8	Analog Output / Digital Output	Analog: 0 to 10V, Digital: 0 to 24V	20mA maximum
	9	0V	0 Volt Common, internally co	onnected to terminal 7
(11)	10	Relay Common		
	11	Relay NO Contact	Contact 250Vac, 6A / 30Vdc,	, 5A

#### 4.8.1. Analog Output

The analog output function may be configured using parameter P-25, which is described in section 6.2 Extended Parameters on page 17. The output has two operating modes, dependent on the parameter selection.

- Analog Mode
  - The output is a 0 10 volt DC signal, 20mA max load current
- Digital Mode
  - The output is 24 volt DC, 20mA max load current

#### 4.8.2. Relay Output

The relay output function may be configured using parameter P-18, which is described in section 6.2 Extended Parameters on page 17.

#### 4.8.3. Analog Inputs

Two analog inputs are available, which may also be used as Digital Inputs if required. The signal formats are selected by parameters as follows

- Analog Input 1 Format Selection Parameter P-16
- Analog Input 2 Format Selection Parameter P-47

These parameters are described more fully in section 6.2 Extended Parameters on page 17.

The function of the analog input, e.g. for speed reference or PID feedback for example is defined by parameters P-15. The function of these parameters and available options is described in section 7 Analog and Digital Input Macro Configurations on page 23.

#### 4.8.4. Digital Inputs

Up to four digital inputs are available. The function of the inputs is defined by parameters P-12 and P-15, which are explained in section 7 Analog and Digital Input Macro Configurations on page 23.

#### 4.9. Motor Thermal overload Protection

#### 4.9.1. Internal Thermal Overload Protection

The drive has an in-built motor thermal overload function; this is in the form of an "I.t-trP" trip after delivering >100% of the value set in P-08 for a sustained period of time (e.g. 150% for 60 seconds).

#### 4.9.2. Motor Thermistor Connection

Where a motor thermistor is to be used, it should be connected as follows:-

Contro	Control Terminal Strip		Additional Information
1	2 3	4	<ul> <li>Compatible Thermistor : PTC Type, 2.5kΩ trip level</li> <li>Use a setting of P-15 that has Input 3 function as External Trip, e.g. P-15 = 3. Refer to section 7 for</li> </ul>
		7	further details. • Set P-47 = " <b>Ptc-th</b> "

# 4.10. EMC Compliant Installation

Category	Supply Cable Type	Motor Cable Type	Control Cables	Maximum Permissible Motor Cable Length
C16	Shielded <sup>1</sup>	Shielded <sup>1,5</sup>	Shielded <sup>4</sup>	1M / 5M <sup>7</sup>
C2	Shielded <sup>2</sup>	Shielded <sup>1, 5</sup>	Shielded	5M / 25M <sup>7</sup>
C3	Unshielded <sup>3</sup>	Shielded <sup>2</sup>		25M / 100M <sup>7</sup>

1/ A screened (shielded) cable suitable for fixed installation with the relevant mains voltage in use. Braided or twisted type screened cable where the screen covers at least 85% of the cable surface area, designed with low impedance to HF signals. Installation of a standard cable within a suitable steel or copper tube is also acceptable.

2/ A cable suitable for fixed installation with relevant mains voltage with a concentric protection wire. Installation of a standard cable within a suitable steel or copper tube is also acceptable.

3/ A cable suitable for fixed installation with relevant mains voltage. A shielded type cable is not necessary.

4/ A shielded cable with low impedance shield. Twisted pair cable is recommended for analog signals.

5/ The cable screen should be terminated at the motor end using an EMC type gland allowing connection to the motor body through the largest possible surface area. Where drives are mounted in a steel control panel enclosure, the cable screen may be terminated directly to the control panel using a suitable EMC clamp or gland, as close to the drive as possible. For IP66 drives, connect the motor cable screen to the internal ground clamp.

6/ Compliance with category C1 conducted emissions only is achieved. For compliance with category C1 radiated emissions, additional measures may be required, contact your Sales Partner for further assistance.

7/ Permissible cable length with additional external EMC filter

# 4.11. Optional Brake Resistor

BFI-E3 Frame Size 2 and above units have a built in Brake Transistor. This allows an external resistor to be connected to the drive to provide improved braking torque in applications that require this.

The brake resistor should be connected to the "+" and "BR" terminals as shown.

The voltage level at these terminals may exceed 800VDC

Stored charge may be present after disconnecting the mains power

Allow a minimum of 5 minutes discharge after power off before attempting any connection to these terminals

Suitable resistors and guidance on selection can be obtained from Beijer Electronics or their Sales Partner.

#### Operation 5.

**5.1. Managing the Keypad** The drive is configured and its operation monitored via the keypad and display.

	<u> </u>		T
$\bigcirc$	NAVIGATE	Used to display real-time information, to access and exit parameter edit mode and to store parameter changes	
$\wedge$	UP	Used to increase speed in real-time mode or to increase	
$\square$	UP	parameter values in parameter edit mode	
$\bigtriangledown$	DOWN	Used to decrease speed in real-time mode or to decrease	
$\vee$	DOWN	parameter values in parameter edit mode	
	RESET /	Used to reset a tripped drive.	
	STOP	When in Keypad mode is used to Stop a running drive.	
$\diamondsuit$	START	When in keypad mode, used to Start a stopped drive or to reverse the direction of rotation if bi-directional keypad mode is enabled

<b>0: It.trp.</b> When the overload accumulator reaches the limit, the drive will tri	p on lt.trp to pre	event damage	to the moto	r.
1: Current Limit Reduction. When the overload accumulator reaches 90% of	f, the output cu	rrent limit is ir	nternally redu	iced to 100%
of P-08 in order to avoid an It trp. The current limit will return to the setting	in P-51 when th	ne overload au	cumulator re	aches 10%

# 6.4. Read Only Status Parameters

Dev	ad Only Status Parameters	E-mlanation
Par.	Description	Explanation
	1 <sup>st</sup> Analog input value (%)	100% = max input voltage
	2 <sup>nd</sup> Analog input value (%)	100% = max input voltage
P00-03	Speed reference input (Hz / RPM)	Displayed in Hz if P-10 = 0, otherwise RPM
P00-04 P00-05	Digital input status User PI output (%)	Drive digital input status Displays value of the User PI output
	DC bus ripple (V)	Measured DC bus ripple
P00-08	Applied motor voltage (V)	Value of RMS voltage applied to motor
	DC bus voltage (V)	Internal DC bus voltage
	Heatsink temperature (°C)	Temperature of heatsink in °C
P00-10	Run time since date of manuf. (Hours)	Not affected by resetting factory default parameters
	Run time since last trip (1) (Hours)	Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip
		occurred. Reset also on next enable after a drive power down.
P00-12	Run time since last trip (2) (Hours)	Run-time clock stopped by drive disable (or trip), reset on next enable only if a trip
		occurred (under-volts not considered a trip) – not reset by power down / power up
		cycling unless a trip occurred prior to power down
-	Trip Log	Displays most recent 4 trips with time stamp
	Run time since last disable (Hours)	Run-time clock stopped on drive disable, value reset on next enable
	DC bus voltage log (V)	8 most recent values prior to trip, 256ms sample time
	Heatsink temperature log (V)	8 most recent values prior to trip, 30s sample time
	Motor current log (A)	8 most recent values prior to trip, 256ms sample time
	DC bus ripple log (V)	8 most recent values prior to trip, 22ms sample time
P00-19	Internal drive temperature log (°C)	8 most recent values prior to trip, 30 s sample time Actual internal ambient temperature in °C
P00-20 P00-21	Internal drive temperature (°C)	Incoming process data (RX PDO1) for CANopen: PI1, PI2, PI3, PI4
	CANopen process data input	
P00-22	CANopen process data output	outgoing process data (TX PDO1) for CANopen: PO1, PO2, PO3, PO4
P00-23	Accumulated time with heatsink > 85°C (Hours)	Total accumulated hours and minutes of operation above heatsink temp of 85°C
P00-24		Total accumulated hours and minutes of operation with drive internal ambient above
	80°C (Hours)	80C
P00-25	Estimated rotor speed (Hz)	In vector control modes, estimated rotor speed in Hz
P00-26	kWh meter / MWh meter	Total number of kWh / MWh consumed by the drive.
P00-27	Total run time of drive fans (Hours)	Time displayed in hh:mm:ss. First value displays time in hrs, press up to display mm:ss.
P00-28	Software version and checksum	Version number and checksum. "1" on LH side indicates I/O processor, "2" indicates power stage
P00-29	Drive type identifier	Drive rating, drive type and software version codes
P00-30	Drive serial number	Unique drive serial number
P00-31	Motor current ld / lq	Displays the magnetising current (Id) and torque current (Iq). Press UP to show Iq
P00-32	Actual PWM switching frequency (kHz)	Actual switching frequency used by drive
P00-33	Critical fault counter – O-I	These parameters log the number of times specific faults or errors occur, and are
P00-34	Critical fault counter – O-Volts	useful for diagnostic purposes.
P00-35	Critical fault counter – U-Volts	
P00-36	Critical fault counter – O-temp (h/sink)	
P00-37	Critical fault counter – b O-I (chopper)	
P00-38	Critical fault counter – O-hEAt (control)	
P00-39	Modbus comms error counter	
	CANbus comms error counter	
P00-40	I/O processor comms errors	
P00-42	Power stage uCcomms errors	
P00-43	Drive power up time (life time) (Hours)	Total lifetime of drive with power applied
	Phase U current offset & ref	Internal value
	Phase V current offset & ref	Internal value
	Phase W current offset & ref	Internal value
P00-47	Fire mode total active time	Total activation time of Fire Mode
P00-48	Scope channel 1 & 2	Displays signals for first scope channels 1 & 2
P00-49	Scope channel 3 & 4	Displays signals for first scope channels 3 & 4
P00-50	Bootloader and motor control	Internal value

# 7. Analog and Digital Input Macro Configurations

# 7.1. Overview

BFI-E3 uses a Macro approach to simplify the configuration of the Analog and Digital Inputs. There are two key parameters which determine the input functions and drive behaviour:-

- P-12 Selects the main drive control source and determines how the output frequency of the drive is primarily controlled.
- P-15 Assigns the Macro function to the analog and digital inputs.

Additional parameters can then be used to further adapt the settings, e.g.

- P-16 Used to select the format of the analog signal to be connected to analog input 1, e.g. 0 10 Volt, 4 20mA
- P-30 Determines whether the drive should automatically start following a power on if the Enable Input is present
- **P-31** When Keypad Mode is selected, determines at what output frequency / speed the drive should start following the enable command, and also whether the keypad start key must be pressed or if the Enable input alone should start the drive.
- P-47 Used to select the format of the analog signal to be connected to analog input 2, e.g. 0 10 Volt, 4 20mA

The diagrams below provide an overview of the functions of each terminal macro function, and a simplified connection diagram for each.

# 7.2. Macro Functions Guide Key

STOP / RUN	Latched input, Close to Run, Open to Stop
Forward Rotation /Reverse Rotation	Selects the direction of motor operation
AI1 REF	Analog Input 1 is the selected speed reference
P-xx REF	Speed setpoint from the selected preset speed
PR-REF	Preset speeds P-20 – P-23 are used for the speed reference, selected according to other digital input
^-FAST STOP (P-24)-^	When both inputs are active simultaneously, the drive stops using Fast Stop Ramp Time P-24
E-TRIP	External Trip input, which must be Normally Closed. When the input opens, the drive trips showing
	E-Er IP or PEc-Eh depending on P-47 setting
(NO)	Normally Open Contact, Momentarily Close to Start
(NC)	Normally Closed Contact, momentary Open to Stop

# 7.10. Fire Mode

The Fire Mode function is designed to ensure continuous operation of the drive in emergency conditions until the drive is no longer capable of sustaining operation. The Fire Mode input must be closed for normal operation – removing the signal from this input will cause the drive to enter Fire Mode. This input may be linked to a fire control system, so that in the event of a fire in the building and drive operation is required to be maintained for the longest possible period in order to clear smoke or maintain air quality within that building. The fire mode function is enabled when P-15 = 14 or 15, with Digital Input 3assigned to activate fire mode.

Fire Mode disables the following protection features in the drive:- O-t (Heat-sink Over-Temperature), U-t (Drive Under Temperature), Th-FLt (Faulty Thermistor on Heat-sink), E-trip (External Trip), 4-20 F(4-20mA fault), Ph-Ib (Phase Imbalance), P-Loss (Input Phase Loss Trip), SC-trp (Communications Loss Trip), I\_t-trp (Accumulated overload Trip)

The following faults will result in a drive trip, auto reset and restart:- O-Volt (Over Voltage on DC Bus), U-Volt (Under Voltage on DC Bus), h O-I (Fast Over-current Trip), O-I (Instantaneous over current on drive output), Out-F (Drive output fault, Output stage trip)

# 7.11. Example Connection Diagrams

# 8. Modbus RTU Communications

# 8.1. Introduction

The drive can be connected to a Modbus RTU network via the RJ45 connector on the front of the drive.

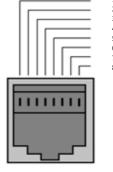

#### 8.2. Modbus RTU Specification

Protocol	Modbus RTU
Error check	CRC
Baud rate	9600bps, 19200bps, 38400bps, 57600bps, 115200bps (default)
Data format	1 start bit, 8 data bits, 1 stop bits, no parity.
Physical signal	RS 485 (2-wire)
User interface	RJ45

#### 8.3. RJ45 Connector Configuration

For full MODBUS RTU register map information please refer to Beijer Electronics.

When using MODBUS control the Analog and Digital Inputs can be configured as shown in section 7.5

CanOpen + CanOpen -O Volts -RS485 (PC) +RS485 (PC) +24 Volt -RS485 (Modbus RTU) +RS485 (Modbus RTU)

# 8.4. Modbus Telegram Structure

The drive supports Master / Slave Modbus RTU communications, using the 03 Read Holding Registers and 06 Write Single Holding Register commands. Many Master devices treat the first Register address as Register 0, therefore it may be necessary to convert the Register Numbers detail in section 8.5 by subtracting 1 to obtain the correct Register address. The telegram structure is as follows:-

Command 03 – Read Holding Registers									
Master Telegram	Le	ngth		Slave Response	Le	ngth			
Slave Address	1	Byte		Slave Address	1	Byte			
Function Code (03)	1	Byte		Starting Address	1	Byte			
1 <sup>st</sup> Register Address	2	Bytes		1 <sup>st</sup> Register Value	2	Bytes			
No. Of Registers	2	Bytes		2 <sup>nd</sup> Register Value	2	Bytes			
CRC Checksum 2 Bytes			Etc						
				CRC Checksum	2	Bytes			

Command 06 – Write Single Holding Register										
Master Telegram	Le	ngth		Slave Response	Le	ngth				
Slave Address	1	Byte		Slave Address	1	Byte				
Function Code (06)	1	Byte		Function Code (06)	1	Byte				
Register Address	2	Bytes		Register Address	2	Bytes				
Value	2	Bytes		Register Value	2	Bytes				
CRC Checksum	2	Bytes		CRC Checksum	2	Bytes				

#### 8.5. Modbus Register Map

Register	Par.	-	Supported	Fu	nction	<b>D</b>	<b>F</b> sharetter
Number		Туре	Commands	Low Byte	High Byte	Range	Explanation
1	-	R/W	03,06	Drive Control Com	mand	03	16 Bit Word.
							Bit 0 : Low = Stop, High = Run Enable
							Bit 1 : Low = Decel Ramp 1 (P-04), High = Decel Ramp 2 (P-24)
							Bit 2 : Low = No Function, High = Fault Reset
							Bit 3 : Low – No Function, High = Coast Stop Request
2	-	R/W	03,06	Modbus Speed refe	erence setpoint	05000	Setpoint frequency x10, e.g. 100 = 10.0Hz
4	-	R/W	03,06	Acceleration and D	eceleration Time	060000	Ramp time in seconds x 100, e.g. 250 = 2.5 seconds
6	-	R	03	Error code	Drive status		Low Byte = Drive Error Code, see section 10.1
							High Byte = Drive Status as follows :-
							0 : Drive Stopped
							1: Drive Running
							2: Drive Tripped
7		R	03	Output Motor Free	luency	020000	Output frequency in Hz x10, e.g. 100 = 10.0Hz
8		R	03	Output Motor Curr	ent	0480	Output Motor Current in Amps x10, e.g. 10 = 1.0 Amps
11	-	R	03	Digital input status		015	Indicates the status of the 4 digital inputs
							Lowest Bit = 1 Input 1
20	P00-01	R	03	Analog Input 1 valu	le	01000	Analog input % of full scale x10, e.g. 1000 = 100%
21	P00-02	R	03	Analog Input 2 valu	le	01000	Analog input % of full scale x10, e.g. 1000 = 100%
22	P00-03	R	03	Speed Reference Value		01000	Displays the setpoint frequency x10, e.g. 100 = 10.0Hz
23	P00-08	R	03	DC bus voltage		01000	DC Bus Voltage in Volts
24	P00-09	R	03	Drive temperature		0100	Drive heatsink temperature in <sup>o</sup> C

All user configurable parameters are accessible as Holding Registers, and can be Read from or Written to using the appropriate Modbus command. The Register number for each parameter P-04 to P-047 is defined as 128 + Parameter number, e.g. for parameter P-15, the register number is 128 + 15 = 143. Internal scaling is used on some parameters, for further details, please contact Beijer Electronics.

# 9.1. Environmental

Operational ambient temperature range

Open Drives:

Enclosed Drives:

Storage ambient temperature range:

Maximum altitude:

Maximum humidity: NOTE For UL complia -10 ... 50°C (frost and condensation free)

-10 ... 40°C (frost and condensation free)

-40 ... 60°C

2000m. Derate above 1000m : 1% / 100m

95%, non-condensing

For UL compliance: the average ambient temperature over a 24 hour period for 200-240V, 2.2kW and 3HP, IP20 drives is 45°C.

### 9.2. Rating Tables

# 9.3. Single Phase Operation of Three Phase Drives

All drive models intended for operation from three phase mains power supply (e.g. model codes BFI-E3-xxxxx-3xxx) may be operated from a single phase supply at up to 50% of maximum rated output current capacity.

In this case, the AC power supply should be connected to L1 (L) and L2 (N) power connection terminals only.

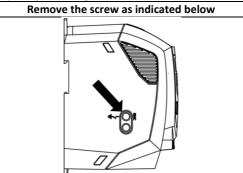

# 9.4. Additional Information for UL Compliance

BFI-E3 is designed to meet the UL requirements. For an up to date list of UL compliant products, please refer to UL listing NMMS.E226333 In order to ensure full compliance, the following must be fully observed.

Supply Voltage	v Requirements           200 – 240 RMS Volts for 230 Volt rated units, + /- 10% variation allowed. 240 Volt RMS Maximum									
	380 – 480 Volts for 400 Volt rated units, + / - 10% variation allowed, Maximum 500 Volts RMS									
Imbalance	Maximum 3% voltage variation between phase – phase voltages allowed									
	All BFI-E3 units have phase imbalance monitoring. A phase imbalance of > 3% will result in the drive tripping. For									
	input supplies which have supply imbalance greater than 3% (typically the Indian sub- continent & parts of Asia									
	Pacific including China) Beijer Electronics recommends the installation of input line reactors.									
Frequency										
Short Circuit Capacity	Voltage Rating	Min kW (HP)	Max kW (HP)	Maximum supply short-circuit current						
	115V	0.37 (0.5)	1.1 (1.5)	100kA rms (AC)						
	230V	0.37 (0.5)	11 (15)	100kA rms (AC)						
	400 / 460V	0.75 (1)	22 (30)	100kA rms (AC)						
	All the drives in the above table are suitable for use on a circuit capable of delivering not more than the ab									
	specified maximum short-circuit Amperes symmetrical with the specified maximum supply voltage when protected									
	by Class J fuses.									
Aechanical Installation	on Requirements									
All BFI-E3 units are inte	nded for indoor installation	within controlled envir	onments which meet t	the condition limits shown in section 9.1						
The drive can be opera	ted within an ambient tempe	erature range as stated	l in section 9.1							
For IP20 units, installat	ion is required in a pollution	degree 1 environment								
For IP66 (Nema 4X) uni	ts, installation in a pollution	degree 2 environment	is permissible							
Frame size 4 drives mu	st be mounted in an enclosu	re in a manner that en	sures the drive is prote	ected from 12.7mm (1/2 inch) of deformatio						
of the enclosure if the e	enclosure impacted.									
lectrical Installation	Requirements									
Incoming power supply	connection must be accordi	ng to 4.3.								
Suitable Power and mo	tor cables should be selected	d according to the data	a shown in section 9.2	and the National Electrical Code or other						
applicable local codes.										
Motor Cable	75°C Copper must be used									
Power cable connection	ns and tightening torques are	e shown in sections 3.3	3 and 3.5.							
Integral Solid Sate shor	t circuit protection does not	provide branch circuit	protection. Branch cire	cuit protection must be provided in						
accordance with the na	tional electrical code and an	y additional local code	es. Ratings are shown ir	n section 9.2						
0 11				ed 480Volt (phase to ground), 480 Volt						
				pulse withstand voltage peak of 4kV.						
UL Listed ring terminals	i / lugs must be used for all b	us bar and grounding	connections							
General Requirement	ts									
•	overload protection in accor									
<ul> <li>Where a mot</li> </ul>	or thermistor is not fitted, or	not utilised, Thermal	Overload Memory Ret	ention must be enabled by setting P-50 = 1						
<ul> <li>Where a mot</li> </ul>	or thermistor is fitted and co	nnected to the drive,	connection must be ca	rried out according to the information show

# 9.5. EMC Filter Disconnect

Drives with an EMC filter have an inherently higher leakage current to Ground (Earth). For applications where tripping occurs the EMC filter can be disconnected (on IP20 units only) by completely removing the EMC screw on the side of the product.

The BFI-E3 product range has input supply voltage surge suppression components fitted to protect the drive from line voltage transients, typically originating from lightning strikes or switching of high power equipment on the same supply.

When carrying out a HiPot (Flash) test on an installation in which the drive is built, the voltage surge suppression components may cause the test to fail. To accommodate this type of system HiPot test, the voltage surge suppression components can be disconnected by removing the VAR screw. After completing the HiPot test, the screw should be replaced and the HiPot test repeated. The test should then fail, indicating that the voltage surge suppression components are once again in circuit.

# **10.Trouble Shooting**

10.1. Fault			
Drive Display Fault Code	Fault Number	Description	Suggested Remedy
no-FLE	00	Drive is healthy and in a stopped co	ndition. The motor is not energised. No enable signal is present to start the drive
01-ь	01	Brake channel over current	Check external brake resistor condition and connection wiring
OL-br	02	Brake resistor thermal overload	The internal software protection for the brake resistor has activated to prevent damage to the brake resistor. If the standard option braking resistor is being used, P-34 MUST be 1 Increase the deceleration time (P-04). Reduce load inertia For Other Brake Resistors, P-34 MUST be 2 Ensure the resistance of the brake resistor is equal to or greater than allowed minimum value. Use an external thermal protection device for the brake resistor.
0-1	03	Instantaneous Over current on the drive output	Check the output wiring connections to the motor and the motor for short circuits phase to phase and phase to earth. Check the motor is free to rotate and there are no mechanical blockages. If the motor has a brake fitted, check the brake is releasing correctly. Check for the correct star-delta motor wiring. Ensure the motor nameplate current is correctly entered in P-08. Increase the acceleration time in P-03. Reduce the motor boost voltage setting in P-11 Investigate overload or malfunction. The acceleration or deceleration times are too short. Increase P-03 or P-04.
I_ t-trP	04	Motor thermal overload protection trip. The drive has tripped after delivering >100% of value in P-08 for a period of time Power stage trip	Ensure the correct motor nameplate current value is entered in P-08. Check for correct Star or Delta wiring configuration. Check to see when the decimal points are flashing (which indicates the output current > P-08 value) and either increase acceleration ramp (P-03) or decrease motor load. Check the total motor cable length is within the drive specification. Check the load mechanically to ensure it is free, and that no jams, blockages or other mechanical faults exist Check for short circuits on the motor and connection cable
PS-ErP	05		
0_Uo IE	06	Over voltage on DC bus	Check the supply voltage is within the allowed tolerance for the drive. If the fault occurs on deceleration or stopping, increase the deceleration time in P-04 or install a suitable brake resistor and activate the dynamic braking function with P-34
U_Uo IE	07	Under voltage on DC bus	The incoming supply voltage is too low. This trip occurs routinely when power is removed from the drive. If it occurs during running, check the incoming power supply voltage and all components in the power feed line to the drive.
0-E	08	Heatsink over temperature	The drive is too hot. Check the ambient temperature around the drive is within the drive specification. Ensure sufficient cooling air is free to circulate around the drive. Increase the panel ventilation if required. Ensure sufficient cooling air can enter the drive, and that the bottom entry and top exit vents are not blocked or obstructed.
U-F	09	Under temperature	Trip occurs when ambient temperature is less than -10°C. Temperature must be raised over -10°C in order to start the drive.
P-dEF	10	Factory Default parameters have been loaded	Press the STOP key, drive is ready to configure for particular application
E-Er iP	11	External trip (on digital Input 3)	E-trip requested on digital input 3. Normally closed contact has opened for some reason. If motor thermistor is connected check if the motor is too hot.
SC-ErP	12	Comms loss trip	Check communication link between drive and external devices. Make sure each drive in the network has its unique address.
FLE-dc	13	DC bus ripple too high	Check incoming supply phases are all present and balanced
P-L055	14	Input phase loss trip	Drive intended for use with a 3 phase supply has lost one input phase.
h 0-1	15	Output Over Current	Check for short circuits on the motor and connection cable
EH-FLE	16	Faulty thermistor on heatsink	
dAF8-E	17	Internal memory fault.	Parameters not saved, defaults reloaded. Try again. If problem recurs, refer to the manufacturer or Authorised Distributor.
4-20 F	18	Analog input current out of range	Check input current in range defined by P-16.
dAFA-E	19	Internal memory fault. (DSP)	Press the stop key. If the fault persists, consult you supplier.
F-Ptc	21	Motor PTC thermistor trip	Connected motor thermistor over temperature, check wiring connections and motor
FAn-F	22	Cooling Fan Fault (IP66 only)	Check / replace the cooling fan
0-hEAL	23	Drive internal temperature too high	Drive ambient temperature too high, check adequate cooling air is provided
DUL-F	26	Output Fault	Indicates a fault on the output of the drive, such as one phase missing, motor phase currents not balanced. Check the motor and connections.
AFE-01	40	Autotune Fault	The motor parameters measured through the autotune are not correct.
AFE-05	41		Check the motor cable and connections for continuity Check all three phases of the motor are present and balanced
AFE-03	42		
AFE-DA	43	]	
AFE- D2	44		
5C-FO I	50	Modbus comms loss fault	Check the incoming Modbus RTU connection cable. Check that at least one register is being polled cyclically within the limit set in P-36 Index 3
5C-F02	51	CANopen comms loss trip	Check the incoming CAN connection cable Check that cyclic communications take place within the timeout limit set in P-36 Index 3

# **About Beijer Electronics**

Beijer Electronics is a fast growing technology company with extensive experience of industrial automation and data communication. The company develops and markets competitive products and solutions that focus on the user. Since its start-up in 1981, Beijer Electronics has evolved into a multinational group present in 22 countries and sales of 1,376 MSEK 2013. The company is listed on the NASDAQ OMX Nordic Stockholm Small Cap list under the ticker BELE.
